Case of Synchronous Occurrence of Gastric Schwannoma and Gastric Adenoma

Gastric schwannomas are rare benign tumors among the mesenchymal tumor of gastrointestinal tract, arising from nerve tissue which has schwann cell sheath. These neoplasms are grossly and clinically similar to GIST, but differentiation of two is important because of aggressive feature of GIST. On the other hands, synchronous occurrence of gastric epithelial and mesenchymal tumours is uncommon, suspected incidental. Also, most mesenchymal tumours are GIST yet. We present the case of 57-year-old male with synchronous gastric schwannoma and gastric adenoma in the stomach. authors found a gastric subepithelial lesion incidentally. during following up, the size of which was increased and tubular adenoma was developed in convering mucosa. the synchronous lesions were removed by wedge resection and subepithelial lesion diagnosed as schwannoma.
